### Proposals

For my project I would like to create an internet shopping platform that will be specifically for clothing or shoes / sneakers. This will definitely incorporate object orientation in java, and will utilize user interaction with different coding concepts that we heavily utilized in class. Part of the shopping will allow users to filter their specific needs so they can waste less time looking for stuff that they are not interested in, for example if someone is a size 8, they can filter it so that only size 8 shoes will appear in their search.

Not a lot of detail. Make sure that what you do requires enough effort for a semester project.
